

Installation of libsodium

1. Go to: <http://download.libsodium.org/libsodium/releases/>
2. For MacOS or Linux, get LATEST.tar.gz, or for Windows get [libsodium-1.0.18-stable-mingw.tar.gz](#)

On MacOS or Linux:

3. Unpack the tarball (tar -xvf LATEST.tar.gz from wherever you downloaded it to), and go into the unpacked directory (cd libsodium-stable).
4. ./configure
5. make
6. sudo make install
7. In NetBeans, add the new header file (sodium.h) and library (libsodium.a) as with other libraries. The header file is located in /usr/local/include/sodium.h, and the library is in /usr/local/lib (libsodium.a).

On Windows:

3. Install a third party application capable of unpacking the tar.gz file that you downloaded in step 2 above. You might try <http://7-zip.org/>.
4. In NetBeans, add the new header file (sodium.h) and library (libsodium.a). These files will be located in the directories where you unpacked the tar.gz file in Step 3.
